findElements(), Handling StaleElementReferenceException and tagName() methods (Selenium 4 - Session 15)

- **findElements()** - Used to find and return <u>more than one</u> Web Element
  - fiindElement() versus findElements()
  - Practical Demonstrations
    - Locating the 'LogIn' button and retrieve the label text on the button
    - Locating the Options in Multi-selection box field and retrieve all the options text
    - Locating a set of hyperlinks under a section and opening them one by one
      - StaleElementReferenceException
      - Handling StaleElementReferenceException
    - Locating all the hyperlinks on the web page and retrieving their href attribute values
- **By.tagName()**
  - Locating the elements using tag name
    - Locating all the elements having the input tag on the web page and printing their type
    - Print all the hyperlink's href attribute value on the web page
